EUROPEAN METALS

2 May 2017

GRANT OF PERMITS

European Metals Holdings Limited (“**European Metals**” or “**the Company**”) (ASX & AIM: EMH) is pleased to announce the recent granting of three key permits in the development of the Cinovec Lithium/Tin Project in the Czech Republic.

HIGHLIGHTS

- **The Preliminary Mining Permit covering the majority of the Cinovec Project has been awarded by the Czech Ministry of Environment.**
- **A further Exploration Licence has been granted for the ground immediately south of the main deposit.**
- **A de-watering permit has been obtained from the Ohře River Authority to pump out the historic workings.**

PRELIMINARY MINING PERMIT

As announced to the market on 3 February 2017, the Cinovec South Resource was formally added to the Czech State resource register, which was the first step in the process of the granting of a mining permit. As a next step, the ‘Preliminary Mining Permit’ (PMP) has now been received. The permit covers approximately 1,500,000 m² of the Cinovec deposit south area (see Figure 1) and is valid until April 2025. The Company has until that date to submit an application for the final mining permit and which it intends to do well before then. The granting of the PMP means that the regulatory oversight for the designated area is transferred from the Ministry of Environment to the Czech Mining Bureau which approves the final mining plan and delimits the final mining space. Both approvals are predicated on the results of an Environmental Impacts Analysis, which the Company has commenced.

ADDITIONAL EXPLORATION LICENCE

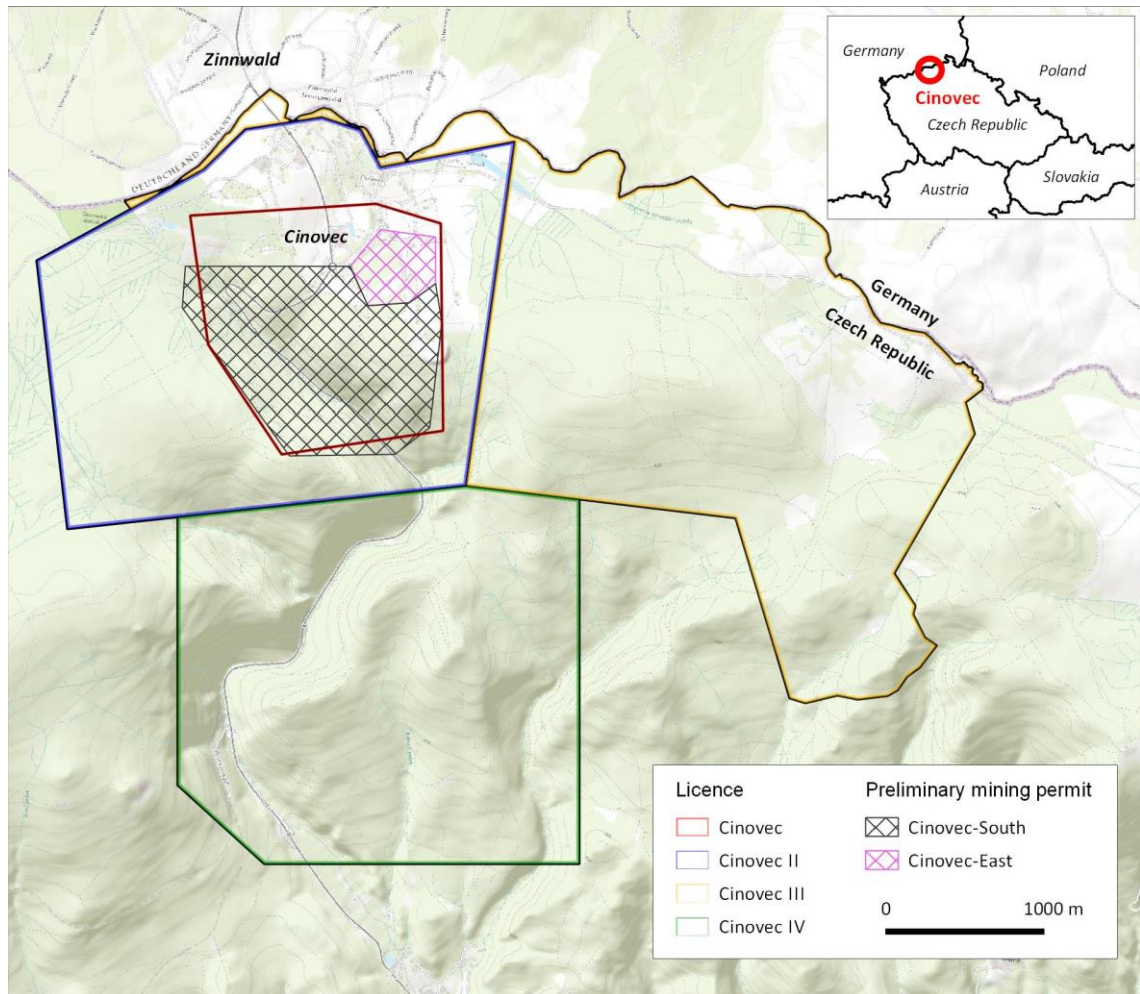

The Company has been awarded an additional exploration licence for the ground immediately south of the deposit (see Figure 1). Securing this area allows the Company to begin preparatory geotechnical work for the exploration adit, including excavation of the adit itself when appropriate.

DE-WATERING PERMIT

The historic Cinovec mine was closed in 1989 and the shafts were capped. Since that time, the workings have been partially flooded. The Company has been working with environmental consultants and relevant local authorities to secure the necessary permits to begin de-watering the mine well in advance of commencing operations. The initial permit has been received and the Company will now finalise the de-watering process. The Company aims to de-water the mine as part of the Definitive Feasibility Study to allow detailed geological, geotechnical and hydrological studies of the deposit. Accessing the underground workings will also allow collecting representative samples for pilot scale lithium carbonate production, which will be used to supply potential off-take customers.

European Metals Managing Director Keith Coughlan commented, “It is very pleasing to receive all of these permits and the licence in a clear and timely fashion. As there has been limited commissioning of new mining operations in the Czech Republic in recent times, the time line for the permitting process has not been specifically determined. The awarding of these permits increases our confidence in the future timing of operations and illustrates the support that development of the Cinovec Project enjoys in the Czech Republic.”

BACKGROUND INFORMATION ON CINOVEC

PROJECT OVERVIEW

Cinovec Lithium/Tin Project

European Metals owns 100% of the Cinovec lithium-tin deposit in the Czech Republic. Cinovec is an historic mine incorporating a significant undeveloped lithium-tin resource with by-product potential including tungsten, rubidium, scandium, niobium and tantalum and potash. Cinovec hosts a globally significant hard rock lithium deposit with a total Indicated Mineral Resource of 348Mt @ 0.45% Li₂O and 0.04% Sn and an Inferred Mineral Resource of 309Mt @ 0.39% Li₂O and 0.04% Sn containing a combined 7.0 million tonnes Lithium Carbonate Equivalent and 263kt of tin.

This makes Cinovec the largest lithium deposit in Europe, the fourth largest non-brine deposit in the world and a globally significant tin resource.

For personal use only

The deposit has previously had over 400,000 tonnes of ore mined as a trial sub-level open stope underground mining operation.

The recently completed Preliminary Feasibility Study, conducted by specialist independent consultants, returned a post tax NPV of USD540m and an IRR of 21%. It confirmed the deposit is be amenable to bulk underground mining. Metallurgical test work has produced both battery grade lithium carbonate and high-grade tin concentrate at excellent recoveries. Cinovec is centrally located for European end-users and is well serviced by infrastructure, with a sealed road adjacent to the deposit, rail lines located 5 km north and 8 km south of the deposit and an active 22 kV transmission line running to the historic mine. As the deposit lies in an active mining region, it has strong community support.

The economic viability of Cinovec has been enhanced by the recent strong increase in demand for lithium globally, and within Europe specifically.

Mr. Keith Coughlan
Managing Director

COMPETENT PERSON

Information in this release that relates to exploration results is based on information compiled by European Metals Director Dr Pavel Reichl. Dr Reichl is a Certified Professional Geologist (certified by the American Institute of Professional Geologists), a member of the American Institute of Professional Geologists, a Fellow of the Society of Economic Geologists and is a Competent Person as defined in the 2012 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves and a Qualified Person for the purposes of the AIM Guidance Note on Mining and Oil & Gas Companies dated June 2009. Dr Reichl consents to the inclusion in the release of the matters based on his information in the form and context in which it appears. Dr Reichl holds CDIs in European Metals.

The information in this release that relates to Mineral Resources and Exploration Targets has been compiled by Mr Lynn Widenbar. Mr Widenbar, who is a Member of the Australasian Institute of Mining and Metallurgy, is a full time employee of Widenbar and Associates and produced the estimate based on data and geological information supplied by European Metals. Mr Widenbar has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity that he is undertaking to qualify as a Competent Person as defined in the JORC Code 2012 Edition of the Australasian Code for Reporting of Exploration Results, Minerals Resources and Ore Reserves. Mr Widenbar consents to the inclusion in this report of the matters based on his information in the form and context that the information appears.

CAUTION REGARDING FORWARD LOOKING STATEMENTS

Information included in this release constitutes forward-looking statements. Often, but not always, forward looking statements can generally be identified by the use of forward looking words such as “may”, “will”, “expect”, “intend”, “plan”, “estimate”, “anticipate”, “continue”, and “guidance”, or other similar words and may include, without limitation, statements regarding plans, strategies and objectives of management, anticipated production or construction commencement dates and expected costs or production outputs.

Forward looking statements inherently involve known and unknown risks, uncertainties and other factors that may cause the company’s actual results, performance and achievements to differ

For personal use only

materially from any future results, performance or achievements. Relevant factors may include, but are not limited to, changes in commodity prices, foreign exchange fluctuations and general economic conditions, increased costs and demand for production inputs, the speculative nature of exploration and project development, including the risks of obtaining necessary licences and permits and diminishing quantities or grades of reserves, political and social risks, changes to the regulatory framework within which the company operates or may in the future operate, environmental conditions including extreme weather conditions, recruitment and retention of personnel, industrial relations issues and litigation.

Forward looking statements are based on the company and its management's good faith assumptions relating to the financial, market, regulatory and other relevant environments that will exist and affect the company's business and operations in the future. The company does not give any assurance that the assumptions on which forward looking statements are based will prove to be correct, or that the company's business or operations will not be affected in any material manner by these or other factors not foreseen or foreseeable by the company or management or beyond the company's control.

Although the company attempts and has attempted to identify factors that would cause actual actions, events or results to differ materially from those disclosed in forward looking statements, there may be other factors that could cause actual results, performance, achievements or events not to be as anticipated, estimated or intended, and many events are beyond the reasonable control of the company. Accordingly, readers are cautioned not to place undue reliance on forward looking statements. Forward looking statements in these materials speak only at the date of issue. Subject to any continuing obligations under applicable law or any relevant stock exchange listing rules, in providing this information the company does not undertake any obligation to publicly update or revise any of the forward looking statements or to advise of any change in events, conditions or circumstances on which any such statement is based.

LITHIUM CLASSIFICATION AND CONVERSION FACTORS

Lithium grades are normally presented in percentages or parts per million (ppm). Grades of deposits are also expressed as lithium compounds in percentages, for example as a percent lithium oxide (Li₂O) content or percent lithium carbonate (Li₂CO₃) content.

Lithium carbonate equivalent ("LCE") is the industry standard terminology for, and is equivalent to, Li₂CO₃. Use of LCE is to provide data comparable with industry reports and is the total equivalent amount of lithium carbonate, assuming the lithium content in the deposit is converted to lithium carbonate, using the conversion rates in the table included below to get an equivalent Li₂CO₃ value in percent. Use of LCE assumes 100% recovery and no process losses in the extraction of Li₂CO₃ from the deposit.

Lithium resources and reserves are usually presented in tonnes of LCE or Li.

The standard conversion factors are set out in the table below:

Table: Conversion Factors for Lithium Compounds and Minerals

| Convert from | | Convert to Li | Convert to Li₂O | Convert to Li₂CO₃ |
|---------------------|---------------------------------|----------------------|-----------------------------------|--|
| Lithium | Li | 1.000 | 2.153 | 5.324 |
| Lithium Oxide | Li ₂ O | 0.464 | 1.000 | 2.473 |
| Lithium Carbonate | Li ₂ CO ₃ | 0.188 | 0.404 | 1.000 |

TECHNICAL GLOSSARY

The following is a summary of technical terms:

| | |
|--|---|
| “beneficiation” or “benefication” | in extractive metallurgy, is any process that improves (benefits) the economic value of the ore by removing the gangue minerals, which results in a higher grade product (concentrate) and a waste stream (tailings) |
| “carbonate” | refers to a carbonate mineral such as calcite, CaCO ₃ |
| “cut-off grade” | lowest grade of mineralised material considered economic, used in the calculation of Mineral Resources |
| “deposit” | coherent geological body such as a mineralised body |
| “exploration” | method by which ore deposits are evaluated |
| “g/t” | gram per metric tonne |
| “grade” | relative quantity or the percentage of ore mineral or metal content in an ore body |
| “Indicated” or “Indicated Mineral Resource” | as defined in the JORC and SAMREC Codes, is that part of a Mineral Resource which has been sampled by drill holes, underground openings or other sampling procedures at locations that are too widely spaced to ensure continuity but close enough to give a reasonable indication of continuity and where geoscientific data are known with a reasonable degree of reliability. An Indicated Mineral Resource will be based on more data and therefore will be more reliable than an Inferred Mineral Resource estimate |
| “Inferred” or “Inferred Mineral Resource” | as defined in the JORC and SAMREC Codes, is that part of a Mineral Resource for which the tonnage and grade and mineral content can be estimated with a low level of confidence. It is inferred from the geological evidence and has assumed but not verified geological and/or grade continuity. It is based on information gathered through the appropriate techniques from locations such as outcrops, trenches, pits, working and drill holes which may be limited or of uncertain quality and reliability |
| “JORC Code” | Joint Ore Reserve Committee Code; the Committee is convened under the auspices of the Australasian Institute of Mining and Metallurgy |
| “kt” | thousand tonnes |
| “LCE” | the total equivalent amount of lithium carbonate (see explanation above entitled Explanation of Lithium Classification and Conversion Factors) |
| “lithium” | a soft, silvery-white metallic element of the alkali group, the lightest of all metals |
| “lithium carbonate” | the lithium salt of carbonate with the formula Li ₂ CO ₃ |
| “Measured” or Measured Mineral Resources” | Measured: a mineral resource intersected and tested by drill holes, underground openings or other sampling procedures at locations which are spaced closely enough to confirm continuity and where geoscientific data are reliably known; a measured mineral resource estimate will be based on a substantial amount of reliable data, interpretation and evaluation which allows a clear determination to be made of shapes, sizes, densities and grades. Indicated: a mineral resource sampled by drill holes, underground openings or other sampling procedures at locations too widely spaced to ensure continuity but close enough to give a reasonable indication of continuity and where geoscientific data are known with a reasonable degree of reliability; an indicated resource will be based on more data, and therefore will be more reliable than an inferred resource estimate. Inferred: a mineral resource inferred from geoscientific evidence, underground openings or other sampling procedures where the lack of data is such that continuity cannot be predicted with confidence and where geoscientific data may not be |

For personal use only

| | |
|--|--|
| “metallurgical” | known with a reasonable level of reliability describing the science concerned with the production, purification and properties of metals and their applications |
| “micrometer” | (symbol μm) is an SI unit of length equal to one millionth of a metre |
| “Mineral Resource” | a concentration or occurrence of material of intrinsic economic interest in or on the Earth’s crust in such a form that there are reasonable prospects for the eventual economic extraction; the location, quantity, grade geological characteristics and continuity of a mineral resource are known, estimated or interpreted from specific geological evidence and knowledge; mineral resources are sub-divided into Inferred, Indicated and Measured categories |
| “mineralisation” | process of formation and concentration of elements and their chemical compounds within a mass or body of rock |
| “Mt” | million tonnes |
| “P80” | the mill circuit product size in micrometers |
| “ppm” | parts per million |
| “PSD” | particle size distribution |
| “recovery” | proportion of valuable material obtained in the processing of an ore, stated as a percentage of the material recovered compared with the total material present |
| “run-of-mine” | mined ore of a size that can be processed without further crushing |
| “semi-autogenous grinding” or “SAG” | a method of grinding rock into fine powder whereby the grinding media consist of larger chunks of rocks and steel balls |
| “stope” | underground excavation within the orebody where the main production takes place |
| “t” | a metric tonne |
| “tin” | A tetragonal mineral, rare; soft; malleable: bluish white, found chiefly in cassiterite, SnO_2 |
| “treatment” | Physical or chemical treatment to extract the valuable metals/minerals |
| “tungsten” | hard, brittle, white or grey metallic element. Chemical symbol, W; also known as wolfram |
| “W” | chemical symbol for tungsten |

ADDITIONAL GEOLOGICAL TERMS

| | |
|----------------------|---|
| “apical” | relating to, or denoting an apex |
| “cassiterite” | a mineral, tin dioxide, SnO_2 . Ore of tin with specific gravity 7 |
| “cupola” | a dome-shaped projection at the top of an igneous intrusion |
| “dip” | the true dip of a plane is the angle it makes with the horizontal plane |
| “glaserite” | A colourless or white crystalline compound, K_2SO_4 , used in glassmaking and fertilisers and as a reagent in analytical chemistry |
| “granite” | coarse-grained intrusive igneous rock dominated by light-coloured minerals, consisting of about 50% orthoclase, 25% quartz and balance of plagioclase feldspars and ferromagnesian silicates |
| “greisen” | a pneumatolitically altered granitic rock composed largely of quartz, mica, and topaz. The mica is usually muscovite or lepidolite. Tourmaline, fluorite, rutile, cassiterite, and wolframite are common accessory minerals |
| “igneous” | said of a rock or mineral that solidified from molten or partly molten material, i.e., from a magma |
| “muscovite” | also known as potash mica; formula: $\text{KAl}_2(\text{AlSi}_3\text{O}_{10})(\text{F,OH})_2$. |
| “quartz” | a mineral composed of silicon dioxide, SiO_2 |
| “rhyolite” | an igneous, volcanic rock of felsic (silica rich) composition. Typically >69% SiO_2 |
| “vein” | a tabular deposit of minerals occupying a fracture, in which particles may |

“wolframite”
“zinnwaldite”

grow away from the walls towards the middle
a mineral, $(\text{Fe,Mn})\text{WO}_4$; within the huebnerite-ferberite series
a mineral, $\text{KLiFeAl}(\text{AlSi}_3\text{O}_{10}(\text{F,OH})_2)$; mica group; basal cleavage; pale violet, yellowish or greyish brown; in granites, pegmatites, and greisens
